

Super Saver Hydroponic Kit

Poly Box grows up to 6 plants in Perlite with Nutrients.

Instructions:

First use a screwdriver to push 6-12 holes in the base of the box for drainage.

Place the box on top of the lid to catch run off.

Empty Perlite (White granular Soil Substitute) into the box until around half to 2/3rds full and wet down with plain water.

Plant seeds just below the surface of the Perlite. If starting from existing plants, wash soil gently off the roots first. Use Hydroshield to treat any soil diseases so they don't spread to the Perlite.

Water the perlite with full strength nutrient when the box is fairly dry. You can tell if Perlite is wet by how heavy the box is when you lift a corner.

Use half strength nutrients on Seedlings and LETTUCE! (or the lettuce may taste bitter)

Flush the box with plain water every 8-10 waterings to keep the nutrients from building up in the Perlite. This can happen over time due to evaporation.

If the plants don't look perfect, call Hydrocentre on 07 5527 4155 or drop in and have a chat. We can help you get it perfect. It's so easy

System Prices.

Single Kit—up to 6 plants. With 500ml Nutrient. Perlite (approx 30L). Just Add seeds, sunlight and water. \$30
